Current Research

My research work focuses on statistical learning, in particular on non-parametric algorithms such as random forests. This class of algorithms exhibits good accuracy in practice but theoretical results do not entirely explain their good empirical performances. Therefore random forests theory is very exciting. I am also interested in the notion of explainable AI and in particular how to provide insights about how the algorithm prediction is built. I am also working on missing value theory, trying to design algorithms that can easily handle this type of data. More recently, I explore the connections between random forests and neural networks, which are also non-parametric algorithms with tremendous empirical performance.
